Intake of ferrous (FE) and non-ferrous metals (NE)

General information:

The biggest difference between *ferrous (FE)* and *non-ferrous (NE) metals* is their magnetic properties. Iron is magnetic.

Materials containing **iron (FE)** can be categorised as follows:

- Ferrous scrap metals, cuttable
- Ferrous light metals (scrap collected by local authority)
- Ferrous mixed scrap
- Ferrous sheet scrap
- Ferrous heavy scrap
- Ferrous scrap metals, not cuttable (machines, installations, furnaces)
- Carrier scrap
- Iron filings
- Cast metal (magnetic)
- Tank plates (boilers)

The following commonly occurring materials can be categorised as **non-ferrous (NE)**. They are often distinguishable by their colour:

- Copper
- Aluminium
- Zinc
- Bronze
- Brass
- White metals (lead or tin alloys)

Notes on payment:

Payments may be made upwards of a given minimum quantity. The minimum quantities depend on the type of material. Any potential payment is also determined by the quality of the goods collected. Adhesions, extraneous matter or mixtures of different materials will decrease the amount that can be paid. Pre-sorted, clean material will usually fetch a higher price.

Disclaimer of liability relating to transportation equipment used by the customer:

The Wiederkehr Group is not liable for damage to transportation equipment used by the customer such as towing vehicles and trailers. In all other respects the T&Cs apply.
